

13.10.2010

Greetings from Intergeo

Intergeo, the world's largest exhibition for geodesy, geoinformation and land management, took place in Cologne, Germany on 5-7 October 2010. Novatron was present at Intergeo for the second time, and for the first time at an own booth. Novatron's "machine control corner" offered demonstrations of both 2D and 3D machine control systems.

Vision LINK was introduced earlier this year, and according to the feedback from the fair visitors, it is currently the most advanced 2D excavator guidance system on the market. Easy-to-visualize 3D graphics, high-quality touch screen and remote support connection are among the things that make Vision LINK a top class excavator system.

Vision 3D is already an established product in the Nordic countries. Remote support, wireless transfer of design and log data, support for most common data formats and support for any brand GNSS receivers are some of the key features of Vision 3D.

Due to receiving so much interest towards our products, Intergeo showed that it is a great forum to exhibit machine control products as well. We would like to thank everyone who visited us in Cologne.

See you in Nuremberg next year!
